Generalizes linear algebra

- *Vector space:* Gaussian elimination \longrightarrow echelon form

$$\left\{ \begin{array}{cccc|c} * & * & * & * & = * \\ * & * & * & * & = * \\ * & * & * & * & = * \\ * & * & * & * & = * \end{array} \right. \longrightarrow \left\{ \begin{array}{cccc|c} * & * & * & * & = * \\ & * & * & * & = * \\ & & * & * & = * \\ & & & * & = * \end{array} \right.$$

- *Polynomial ring:* Buchberger's algorithm \longrightarrow Gröbner basis

Buchberger's algorithm

Given $F \in \mathbb{F}[x_1, \dots, x_n]^m$:

- ① $G := F$
- ② Consider all $p, q \in G$
 - ① Compute $S := up - vq$
(u, p cancel lcm(ltp, ltq))
 - ② Top-reduce S over G
(divisibility of lts: $S - u_1g_1 - u_2g_2 - \dots$)
 - ③ $S = 0? \implies$ Append S to G
- ③ Termination: *no new polynomials* created
(Ascending Chain Condition)
 - All GB algorithms follow this general outline (F5 too!)
 - Omitting some details (lt=???)

Faugère's original
argument

Non-terminating
example... terminates!

Variants that guarantee
termination

Quick example

Problem: Find Gröbner basis of $\langle xy + 1, y^2 + 1 \rangle$.

① $G = (xy + 1, y^2 + 1)$

① $S = y(xy + 1) - x(y^2 + 1) = y - x$
No top-reduction

② $G = (xy + 1, y^2 + 1, x - y)$

① $S = (xy + 1) - y(x - y) = 1 + y^2$
Top-reduces to zero

② $S = x(y^2 + 1) - y^2(x - y) = x + y^3$
Top-reduces to zero

Bottleneck

- Bottleneck

- New polynomials \rightarrow new information
- Top-reduction to zero \nrightarrow no new polynomial

\nrightarrow new information

- $(100 - \epsilon)\%$ of time: verifying GB, *not* computing
- Top-reduction *very, very expensive*

Past work

- *Predict zero reductions*
(B Buchberger 1985, R Gebauer-H Möller 1988, CKR 2002, H Hong-J Perry 2007)
- *Selection strategy*: Pick pairs in clever ways
(B Buchberger 1985, A Giovini et al 1991, H Möller et al 1992)
- *Forbid some top-reductions*: Involutive bases
(V Gerdt-Y Blinkov 1998)
- *Homogenization*: d -Gröbner bases

Non-terminating example... terminates!

Variants that guarantee termination

How to predict zero reductions?

- Recall

$$\left(\begin{array}{cccccccc} x^3y & x^2y^2 & xy^3 & y^4 & x^2b^2 & xyb^2 & y^2b^2 & b^4 & & \\ & & & & & & & & & \vdots \\ & & & & & & 1 & & -1 & b^2g_1 \\ & & & & & & & & & \vdots \\ & & & & & & 1 & -1 & & yg_3 \end{array} \right)$$

We did not cancel. *Why not?*

- S*-poly top-reduces to zero
- can predict this*

How?

How to predict zero reductions?

- Recall

$$\left(\begin{array}{cccccccc} x^3y & x^2y^2 & xy^3 & y^4 & x^2b^2 & xyb^2 & y^2b^2 & b^4 & & \\ & & & & & & & & & \vdots \\ & & & & & & 1 & & -1 & b^2g_1 \\ & & & & & & & & & \vdots \\ & & & & & & 1 & -1 & & yg_3 \end{array} \right)$$

We did not cancel. *Why not?*

- S -poly top-reduces to zero
- can predict this*

How?

Faugère's criterion

Theorem

If

- $u\text{Sig}(p) = ug_i$; and
- $\text{lt}(q) \mid u, \exists q \in \text{GB}_{\text{prev}}(g_1, \dots, g_{i-1})$;

then $u\text{Sig}(p)$ is not minimal.

Definition

$\text{FC}(u\text{Sig}(p))$: $\text{lt}(q) \mid u \exists q \in G_{\text{prev}}$

Corollary

*In S -polynomial $up - vq$,
if $\text{FC}(u\text{Sig}(p))$ or $\text{FC}(v\text{Sig}(q))$
then we need not compute S .*

Faugère's criterion

Theorem

If

- $u\text{Sig}(p) = ug_i$; and
- $\text{lt}(q) \mid u, \exists q \in \text{GB}_{\text{prev}}(g_1, \dots, g_{i-1})$;

then $u\text{Sig}(p)$ is not minimal.

Definition

$\text{FC}(u\text{Sig}(p))$: $\text{lt}(q) \mid u \exists q \in G_{\text{prev}}$

Corollary

*In S -polynomial $up - vq$,
if $\text{FC}(u\text{Sig}(p))$ or $\text{FC}(v\text{Sig}(q))$
then we need not compute S .*

In the example...

- Recall

$$\left(\begin{array}{cccccccc} x^3y & x^2y^2 & xy^3 & y^4 & x^2b^2 & xyb^2 & y^2b^2 & b^4 & & \\ & & & & & & & & & \vdots \\ & & & & & & 1 & & -1 & b^2g_1 \\ & & & & & & & & & \vdots \\ & & & & & & 1 & -1 & & yg_3 \end{array} \right)$$

- $G_{\text{prev}} = (g_1)$
- $\text{Sig}(g_3) = xg_2$
- $yg_3 \text{Sig}(g_3) = xyg_2$, and $\text{lt}(g_1) \mid xy \dots$

FC \implies no need to compute S-polynomial

Why?

In the example...

- Recall

$$\left(\begin{array}{cccccccc} x^3y & x^2y^2 & xy^3 & y^4 & x^2b^2 & xyb^2 & y^2b^2 & b^4 & & \\ & & & & & & & & & \vdots \\ & & & & & & & & & \\ & & & & & & 1 & & -1 & b^2g_1 \\ & & & & & & & & & \vdots \\ & & & & & & & & & \\ & & & & & & 1 & -1 & & yg_3 \end{array} \right)$$

- $G_{\text{prev}} = (g_1)$
- $\text{Sig}(g_3) = xg_2$
- $y\text{Sig}(g_3) = xyg_2$, and $\text{lt}(g_1) \mid xy\dots$

FC \implies no need to compute S-polynomial

Why?

Zero reductions?

Definition

If $G = (g_1, \dots, g_m)$ has trivial syzygies *only*,
then G is a **regular sequence**.

*Many systems are regular sequences;
many non-regular systems can be rewritten as regular.*

Corollary

*If input to F5 is a regular sequence,
then no zero reductions occur.*

Motivation

- little public code...
 - Stegers: Magma
 - I don't have Magma
 - I like Sage, can use Maple
 - FGb source code not public
- compare with other algorithms
 - selection strategy
 - predicting zero reduction
 - time/space tradeoff?

Implementations (1)

- Faugère (2002)
 - C, interfaces w/Maple
 - *Very* fast
 - Several variants: F5, F5', F5", ...?
 - Source code not publicly available, binary download
- Stegers (2005)
 - Interpreted Magma code
 - Respectable timings
 - Variant "F5R"
 - <http://wwwcsif.cs.ucdavis.edu/~stegers/>
- Others
 - Unstable implementations
 - Magma implementation?

Implementations (2)

- Perry (2007)
 - Interpreted Maple code
 - Embarassingly slow
 - Source code publicly available  unmaintained
- Eder, Perry (2008)
 - Interpreted Singular code
 - Respectable timings
 - New variant “F5C”
 - <http://www.math.usm.edu/perry/research.html>

Implementations (3)

- Albrecht (2008)
 - Interpreted Sage/Python code
 - Faster than Eder, Perry (2008)
 - Variants F5, F5R, F5C
 - http://bitbucket.org/malb/algebraic_attacks/
- King (2008)
 - Compiled Sage/Cython code
 - Faster than Eder, Perry (2008) and Albrecht (2008)?
 - Variant F5R; variants F5 and F5C by Perry
 - <http://www.math.usm.edu/perry/research.html>
- Eder (in progress)
 - *F5 in Singular kernel*
 - Access to many Singular optimizations
 - Sage uses Singular, so direct benefit to Sage
 - Source code will be publicly available

So you want to implement F5...

- Faugère's pseudocode:

`www-spaces.lip6.fr/@papers/F02a.pdf`

(2004 edition, corrected!)

- Stegers' pseudocode:

`wwwcsif.cs.ucdavis.edu/~stegers/`

(contains errors)

- Perry's pseudocode:

`www.math.usm.edu/perry/research.html`

(used for Singular, Sage implementations)

Faugère's original argument

Theorem

*If reduction stage concludes without zero reductions,
then ideal of L_t 's has increased.*

This theorem is wrong.

Example (Gash, 2008)

- Uses Faugère's example (2002 paper)
- Consider S -polynomials in different order
- \rightsquigarrow no reduction to zero
and ideal of L_t 's does not increase.
- “redundant polynomials”

Redundant polynomials: necessary?

Why does F5 compute redundant polynomials?

- Some top-reductions forbidden
- Redundant polynomials restore necessary top-reductions

Example

- p_1 top-reducible by p_2 , but forbidden
- p_1 added to GB \rightsquigarrow new rewrite rule
- p_3 top-reducible by p_1 ? *now allowed*
- equivalent to top-reduction by p_2

Redundant polynomials: necessary?

Why does F5 compute redundant polynomials?

- Some top-reductions forbidden
- Redundant polynomials restore necessary top-reductions

Example

- p_1 top-reducible by p_2 , but forbidden
- p_1 added to GB \rightsquigarrow new rewrite rule
- p_3 top-reducible by p_1 ? *now allowed*
- equivalent to top-reduction by p_2

Possible resolution...?

An idea:

- Suppose reduction stage returns redundant polynomials
 - d -Gröbner basis!
- keep polys, but...
- not their S -polys
 - multiples of reducers' S -polynomials
- **Guaranteed termination!** *but...*
- No longer guaranteed correct!
 - Non-trivial concern: **Cyclic-7 oops!**
 - Rewrite rules \implies non-computed S -polys!

3 Termination (?)

The difficulty

Faugère's original argument

Non-terminating example... terminates!

Variants that guarantee termination

Non-terminating examples

- Widespread belief: F5 does not always terminate
- Proposals for non-terminating systems
 - Stegers' `nonTerminatingExample.mag`
 - Brickenstein's example
(private communication, exploit iterative computation)
- However...
 - Singular and Sage: *both* systems terminate

nonTerminatingExample.mag

Termination in Singular and Sage, not in Magma?!?

- Error in implementation
 - Rewrite rules sometimes not assigned
 - Some top-reductions not completed
- Correction \rightsquigarrow termination!
